Biomedical Engineering

Biomedical engineering is the branch of engineering that applies principles of engineering to the medical field. It can encompass a wide range of topics, from developing new medical devices to improving healthcare delivery systems.

Competencies required on each student's profile: Analytical skills, Communication skills, advanced mathematics techniques, creativity, programming, and problem-solving skills.

METHODOLOGY

TRADITIONAL CLASSROOM

FLIPPED CLASSROOM

On flipped classrooms, students encounter information before class, freeing class time for activities that involve higher order thinking.

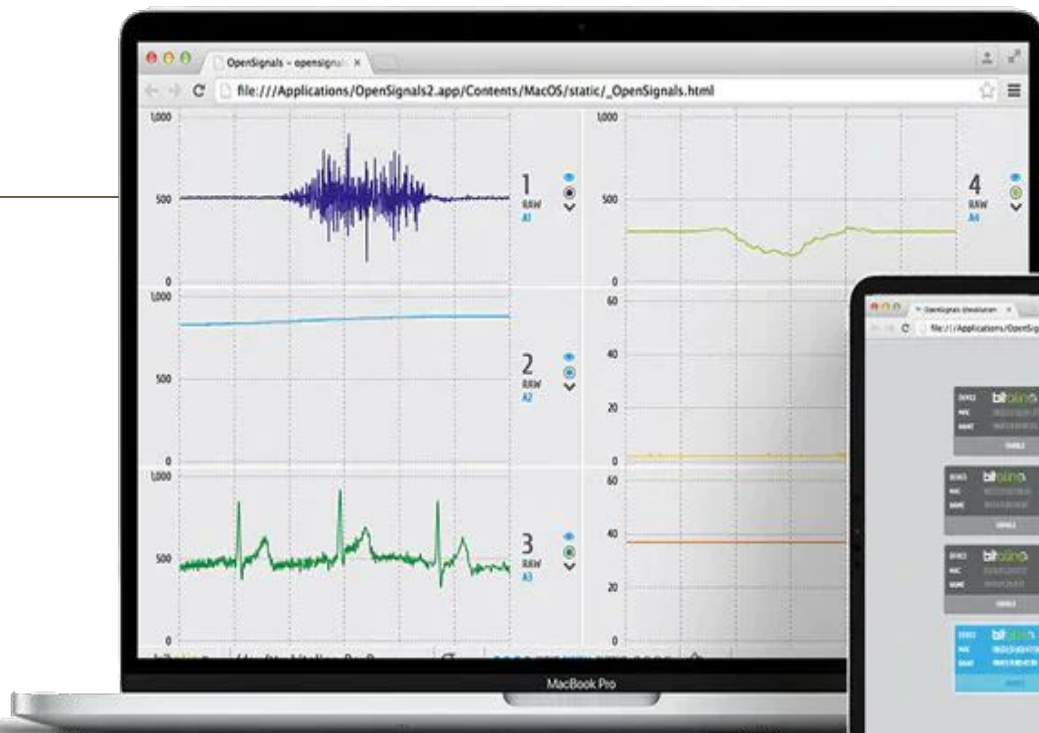

1 week before is sent these materials:

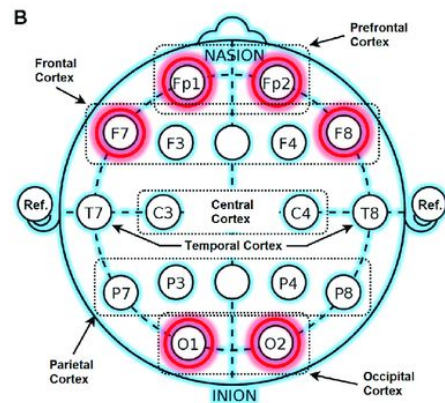

- laboratory guide.
- Scientific papers.
- Short videos.
- Manual of use from Bitalino/UltraCortex.

Anatomy of a Bitalino

Tiny Machine Learning Kit

El Arduino Tiny Machine Learning Kit es una herramienta completa para principiantes interesados en aprender sobre el aprendizaje automático embebido, al incluir desde una placa Arduino hasta una cámara y varios sensores. Con este kit, los usuarios pueden desarrollar proyectos de aprendizaje automático embebido, como detectores de gestos, clasificadores de imágenes o monitores de temperatura.

Análisis Electromiográfico de Superficie del Antebrazo en las Técnicas Forehand y Backhand en Jugadores de Mesa

Facultad de Ciencias e Ingeniería - Ingeniería Biomédica - Introducción a Señales Biomédicas

Dr. Thelí Grández, Gianni Allis, Zubiate Castillo, María del Carmen; Tintaya Salva, Jossel; Mucha Hurturo, Christian

INTRODUCCIÓN

El brazo de mesa es un músculo de gran importancia en la actividad y precisión de un jugador de mesa. Para analizar el movimiento de la mano y el antebrazo se requiere de sensores que permitan cuantificar los movimientos. En este estudio se utilizó un sensor de actividad física (Fitbit) para medir el nivel de actividad física de los jugadores de mesa. El objetivo de este estudio es analizar el nivel de actividad física de los jugadores de mesa y su relación con el rendimiento de los mismos.

MATERIALES Y MÉTODOS

Se utilizaron 10 jugadores de mesa de nivel intermedio para el estudio. Se les colocó un sensor de actividad física (Fitbit) en la muñeca de la mano dominante. Se les pidió que jugaran una partida de mesa durante 30 minutos. Se registró el nivel de actividad física de los jugadores durante el juego. Los datos se analizaron utilizando el software de análisis de datos de Fitbit.

CONCLUSIONES

Se concluye que el nivel de actividad física de los jugadores de mesa es bajo durante el juego. Esto sugiere que el juego de mesa es una actividad física de baja intensidad. Se recomienda que los jugadores de mesa realicen ejercicios de actividad física antes y después del juego para mejorar su rendimiento.

Sistema de análisis de marcha en la zona plantar

El Sistema de Análisis de Marcha en la Zona Plantar (SAM) es un sistema de análisis de marcha que permite cuantificar los movimientos de la planta del pie. El objetivo de este estudio es analizar el nivel de actividad física de los jugadores de mesa y su relación con el rendimiento de los mismos.

CONCLUSIONES Y RECOMENDACIONES

Se concluye que el nivel de actividad física de los jugadores de mesa es bajo durante el juego. Esto sugiere que el juego de mesa es una actividad física de baja intensidad. Se recomienda que los jugadores de mesa realicen ejercicios de actividad física antes y después del juego para mejorar su rendimiento.

The didactic experience in a biomedical engineering course at a Peruvian university

Abstract:

The systematization of the didactic experience, delivered in a university course on the processing of biosignals, becomes relevant for continuous improvement in its subsequent editions. This applies both at the structural level and for enhancing the content of the course, not only in the theoretical aspect but also in practical aspects. The following study describes the experiences under a flipped learning approach obtained from questionnaires related to the student's perception of the delivery of the course "Introduction to Biomedical Signals", which is part of the biomedical engineering program offered by a Peruvian University during the 2023-I semester from March to July 2023. The course showed an overall evaluation over the average, demonstrating its adequate implementation and satisfaction of students. Qualitative questions captured the perception of students regarding how to improve the course experience as well.

Abstract

cardiovascular diseases are still the pathologies that generate the highest mortality and economic costs globally. In Latin America, low-income populations are the most vulnerable. Singularly, this population has an incidence of endemic diseases that can lead to blocks of the bundle branch of His. The following study seeks to develop a cardiac abnormality detection system using machine learning techniques and microcontrollers with limited resources to benefit populations with limited access to health environments. The Arduino Nano 33 BLE Sense is employed as the hardware platform due to its ARM Cortex M4 processor and support for TensorFlow Lite. An electrocardiogram (ECG) database is processed using oversampling and under-sampling techniques to address class imbalance. Spectral features are extracted using wavelet transforms, and a multilayer neural network is implemented for classification. Two class balancing approaches are compared: oversampling and undersampling. Results indicate notable improvements in the model's ability to identify instances of minority classes with the oversampling approach, while undersampling may lead to information loss. The system's performance is evaluated using key metrics such as precision, recall, and F1-Score. Additionally, computational resources required to implement the model on the Arduino Nano 33 BLE Sense are estimated, with an assessment of Flash and RAM consumption. This analysis is essential to ensure the feasibility of implementation on resource-constrained devices. This work contributes to the advancement of early detection of cardiac anomalies in resource-limited settings, with significant implications for healthcare in underserved communities and rural areas. © 2023 IEEE.
